

DeZURIK Balancing Valves, available in 1 - 24" (25 - 600mm) sizes, are designed specifically for heating/air conditioning systems in multi-story commercial buildings. Balancing valves provide a means of adjusting and reading the flow in condenser and hot or chilled water systems. They maintain the desired flow, balancing point and temperature throughout the building. Flow curves, representing the valve characteristics for DeZURIK Balancing Valves by individual valve size, are provided for use in balancing and measuring flow in heating/air conditioning systems.

For complete details on DeZURIK Balancing Valves, refer to Bulletin 12.30-1, or contact your local representative.
