Lockout Device for Handwheel Actuated KSL Slurry Knife Gate Valves

Description
The lockout device is designed to prevent operation of the handwheel actuated valve.

The lockout device consists of a lockout, a pin and a tether that is attached to the lock out pin and the leg fab of the valve. See Figure 1.

The customer must provide a padlock or other device to secure the lockout in the locked position.

Operation

**Locking the Valve**
1. Remove the pin from the lockout and remove the lockout from the leg fab.
2. Insert the lockout into the hole in the leg fab from the side nearest the handwheel.
3. Set and lock the pin in the leg fab by inserting a customer-supplied pad lock or other device into the bottom hole in the lockout. See Figure 2.

**Unlocking the Valve**
1. Remove the padlock or other locking device from the lockout.
2. Remove the lockout from the leg fab.
3. Insert the lockout into the hole from the side nearest the valve.
4. Place the pin into the hole in the lockout to secure it to the leg fab. See Figure 3.
