1. Introduction

This Safety Manual provides information necessary to design, install, verify and maintain a Safety Instrumented Function (SIF) utilizing the DeZURIK Cylinder Actuator. This manual provides necessary requirements for meeting the IEC 61508 or IEC 61511 functional safety standards.

1.1 Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safety</td>
<td>Freedom from unacceptable risk of harm</td>
</tr>
<tr>
<td>Functional Safety</td>
<td>The ability of a system to carry out the actions necessary to achieve or to maintain a defined safe state for the equipment / machinery / plant / apparatus under control of the system</td>
</tr>
<tr>
<td>Basic Safety</td>
<td>The equipment must be designed and manufactured such that it protects against risk of damage to persons by electrical shock and other hazards and against resulting fire and explosion. The protection must be effective under all conditions of the nominal operation and under single fault condition</td>
</tr>
<tr>
<td>Safety Assessment</td>
<td>The investigation to arrive at a judgment - based on evidence - of the safety achieved by safety-related systems</td>
</tr>
<tr>
<td>Fail-Safe State</td>
<td>State where solenoid valve is de-energized and spring is extended.</td>
</tr>
<tr>
<td>Fail Safe</td>
<td>Failure that causes the valve to go to the defined fail-safe state without a demand from the process.</td>
</tr>
<tr>
<td>Fail Dangerous</td>
<td>Failure that does not respond to a demand from the process (i.e. being unable to go to the defined fail-safe state).</td>
</tr>
<tr>
<td>Fail Dangerous Undetected</td>
<td>Failure that is dangerous and that is not being diagnosed by automatic stroke testing.</td>
</tr>
<tr>
<td>Fail Dangerous Detected</td>
<td>Failure that is dangerous but is detected by automatic stroke testing.</td>
</tr>
<tr>
<td>Fail Annunciation Undetected</td>
<td>Failure that does not cause a false trip or prevent the safety function but does cause loss of an automatic diagnostic and is not detected by another diagnostic.</td>
</tr>
<tr>
<td>Fail Annunciation Detected</td>
<td>Failure that does not cause a false trip or prevent the safety function but does cause loss of an automatic diagnostic or false diagnostic indication.</td>
</tr>
<tr>
<td>Fail No Effect</td>
<td>Failure of a component that is part of the safety function but that has no effect on the safety function.</td>
</tr>
<tr>
<td>Low demand mode</td>
<td>Mode, where the frequency of demands for operation made on a safety-related system is no greater than twice the proof test frequency.</td>
</tr>
</tbody>
</table>
1.2 Abbreviations

- **FMEDA**: Failure Modes, Effects and Diagnostic Analysis
- **HFT**: Hardware Fault Tolerance
- **MOC**: Management of Change. These are specific procedures often done when performing any work activities in compliance with government regulatory authorities.
- **PFDavg**: Average Probability of Failure on Demand
- **SFF**: Safe Failure Fraction, the fraction of the overall failure rate of a device that results in either a safe fault or a diagnosed unsafe fault.
- **SIF**: Safety Instrumented Function, a set of equipment intended to reduce the risk due to a specific hazard (a safety loop).
- **SIL**: Safety Integrity Level, discrete level (one out of a possible four) for specifying the safety integrity requirements of the safety functions to be allocated to the E/E/PE safety-related systems where Safety Integrity Level 4 has the highest level of safety integrity and Safety Integrity Level 1 has the lowest.
- **SIS**: Safety Instrumented System – Implementation of one or more Safety Instrumented Functions. A SIS is composed of any combination of sensor(s), logic solver(s), and final element(s).

1.3 Product Support

Product support can be obtained from:

1.5 Reference Standards
Functional Safety
- ANSI/ISA 84.00.01-2004 (IEC 61511 Mod.) Functional Safety – Safety Instrumented Systems for the Process Industry Sector

2 Device Description
The cylinder used with DeZURIK gate valves is a pneumatic double-acting cylinder that requires a
- supply pressure between 60 and 100 psi.

2.1 Safety Function
When de-energized, the actuator moves the valve to their fail-safe position. Depending on the
version specified Fail – Closed or Fail - Open, the valve will rotate the valve plug to close off the
flow path through the valve body or open the flow path through the valve body.
The valve is intended to be part of final element subsystem as defined per IEC 61508 and the
achieved SIL level of the designed function must be verified by the designer.

2.2 Environmental limits
The designer of a SIF must check that the product is rated for use within the expected
environmental limits. Refer to the DeZURIK Cylinder Actuator Brochure for environmental limits.

2.3 Application limits
The materials of construction of DeZURIK Cylinder Actuator are specified in the DeZURIK
brochure. It is especially important that the designer check for material compatibility considering
on-site chemical contaminants and air supply conditions. If the DeZURIK KSV knife gate valve is
used outside of the application limits or with incompatible materials, the reliability data provided
becomes invalid.

2.4 Design Verification
A detailed Failure Mode, Effects, and Diagnostics Analysis (FMEDA) report is available from
DeZURIK. This report details all failure rates and failure modes as well as the expected lifetime.
The achieved Safety Integrity Level (SIL) of an entire Safety Instrumented Function (SIF) design
must be verified by the designer via a calculation of PFDAVG considering architecture, proof test
interval, proof test effectiveness, any automatic diagnostics, average repair time and the specific
failure rates of all products included in the SIF. Each subsystem must be checked to assure
compliance with minimum hardware fault tolerance (HFT) requirements.
When using DeZURIK Cylinder Actuator in a redundant configuration, a common cause factor of at least 5% should be included in safety integrity calculations.

The failure rate data listed the FMEDA report is only valid for the useful life time of a DeZURIK Cylinder Actuator. The failure rates will increase sometime after this time period. Reliability calculations based on the data listed in the FMEDA report for mission times beyond the lifetime may yield results that are too optimistic, i.e. the calculated Safety Integrity Level will not be achieved.

2.5 SIL Capability

2.5.1 Systematic Integrity

The product has met manufacturer design process requirements of Safety Integrity Level (SIL) 3. These are intended to achieve sufficient integrity against systematic errors of design by the manufacturer. A Safety Instrumented Function (SIF) designed with this product must not be used at a SIL level higher than the statement without "prior use" justification by end user or diverse technology redundancy in the design.

2.5.2 Random Integrity

The failure rate data used for this analysis meets the exida criteria for Route 2H. Therefore the KGC Cast Stainless Steel Knife Gate Valve can be classified as a 2H device when the listed failure rates are used. When 2H data is used for all of the devices in an element, then the element meets the hardware architectural constraints up to SIL 2 at HFT=O (or SIL 3 @ HFT=1) per Route 2H. If Route 2H is not applicable for the entire final element, the architectural constraints will need to be evaluated per Route 1H.

2.5.3 Safety Parameters

For detailed failure rate information refer to the Failure Modes, Effects and Diagnostic Analysis Report for the DeZURIK Cylinder Actuator.

2.6 Connection of the DeZURIK Cylinder Actuator to the SIS Logic-solver

There is no direct connection to the SIS logic-solver to KSV knife gate valves; however it may be part of final element which would be actuators, solenoid valves or any control devices that connected to the KSV valve assembly.

2.7 General Requirements

All SIS components including the DeZURIK Cylinder Actuator must be operational before process start-up.

User shall verify that the DeZURIK Cylinder Actuator is suitable for use in safety applications by confirming the DeZURIK Cylinder Actuator nameplates are properly marked.

Personnel performing maintenance and testing on the DeZURIK Cylinder Actuator shall be competent to do so.
Results from the proof tests shall be recorded and reviewed periodically.

The useful life of the DeZURIK Cylinder Actuator is discussed in the Failure Modes, Effects and Diagnostic Analysis Report.

3 Installation and Commissioning

3.1 Installation

The valve must be installed as per standard practices outlined in the Installation Manual D11021. The environment must be checked to verify that environmental conditions do not exceed the ratings. The valve must be accessible for physical inspection.

3.2 Physical Location and Placement

The valve shall be accessible with sufficient room for pneumatic connections and shall allow manual proof testing.

Pneumatic piping to the valve shall be kept as short and straight as possible to minimize the airflow restrictions and potential clogging. Long or kinked pneumatic tubes may also increase the valve closure time.

The valve shall be mounted in a low vibration environment. If excessive vibration can be expected special precautions shall be taken to ensure the integrity of pneumatic connectors or the vibration should be reduced using appropriate damping mounts.

4 Operations and Maintenance

4.1 Proof testing

The objective of proof testing is to detect failures within DeZURIK Cylinder Actuator that are not detected by any automatic diagnostics of the system. The primary concern is undetected failures that prevent the safety instrumented function from performing its intended function.

The frequency of proof testing, or the proof test interval, is to be determined in reliability calculations for the safety instrumented functions for which a DeZURIK Cylinder Actuator is applied. The proof tests must be performed more frequently than or as frequently as specified in the calculation in order to maintain the required safety integrity of the safety instrumented function.

The following proof test is recommended. The results of the proof test should be recorded and any failures that are detected and that compromise functional safety should be reported to DeZURIK.

4.2 Suggested Proof Test

The suggested proof test consists of a full stroke of the valve, see Table 1. The Proof Test Coverage for this test is listed in Table 2.

Table 1 Suggested Proof Test

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>

D11038
1. Bypass the safety function and take appropriate action to avoid a false trip.

2. Interrupt or change the signal/supply to the actuator to force the actuator and valve to the Fail-Safe state and confirm that the Safe State was achieved and within the correct time.

3. Re-store the supply/signal to the actuator and inspect for any visible damage or contamination and confirm that the normal operating state was achieved.

4. Inspect the valve for any leaks, visible damage or contamination.

5. Remove the bypass and otherwise restore normal operation.

For the test to be effective the movement of the valve must be confirmed. To confirm the effectiveness of the test both the travel of the valve and slew rate must be monitored and compared to expected results to validate the testing.

4.3 Proof Test Coverage

The Proof Test Coverage for the various product configurations is given in Table 2.

Table 2 Proof Test Coverage- KGC Cast Stainless Steel Knife Gate Valve

<table>

</tbody>
</table>

Table1: Recommended Proof Test

This test will detect >70% of possible DU failures in the valve for the Full Stroke options. (For the Tight Shutoff and Open to Trip options the proof test coverage is >25%, and > 90% respectively).

The person(s) performing the proof test of a DeZURIK Cylinder Actuator should be trained in SIS operations, including bypass procedures, valve maintenance and company Management of Change procedures. No special tools are required.

4.4 Repair and replacement

Repair procedures in the DeZURIK Cylinder Actuator Installation, Operation and Maintenance manual must be followed.
4.5 Useful Life
The useful life of the KSV knife gate valve is 5 to 10 years, or 10,000 cycles

4.6 Manufacture Notification
Any failures that are detected and that compromise functional safety should be reported to DeZURIK. Please contact DeZURIK customer service.
