WILLAMETTE CONE VALVES (VMC)

A Valve That Will Last for Decades

Willamette Cone Valves (VMC) are built tough to last under the most severe conditions. Every valve is designed and built for precise operation, long life and low maintenance. The VMC is available in sizes 6-48" (150-1200mm). Standard design pressures are up to 300 psi (2068 kPa).

Dependable Operation in Tough Applications

Cone Valves are designed with wide, weldedon Monel metal seats that eliminate erosion and abrasion failures commonly associated with polymer and elastomer seals in other valve types. The robust metal-to-metal seating ensures dependable operation and typically requires no replacement or preventive maintenance under normal conditions.

This durable seating design makes the valve ideal for challenging applications where high velocities and continuous throttling are necessary.

Design & Construction Features

Each valve consists of a conical plug that fits precisely into a mating valve body, along with a head cover, valve operating mechanism, and actuator. These are 100% full port, conical plug-type valves with a circular waterway through both the body and plug when in the fully open position.

The valve body features weld-overlayed Monel seats around the bore, which are accurately precision machined after welding. The conical plug can be equipped with either fo ur (4) seats or two (2) seats. For valves equipped with four (4) seats, one pair of seats engages the body seat in the open position, while the other pair engages in in the closed position (rotated 90 degrees.) For valves equipped with two (2) seats, one pair of seats engages the body seat in the closed position.

In operation, the plug is first lifted to separate the seat from the valve body seat. It is then rotated 90° to the desired open or closed position before being lowered to reseat in place. The body and plug seat are designed to form a secure, consistent and dependable closure.

Metal-to-metal seats mate firmly and accurately to provide tight shutoff and adheres to the allowable leak rate AWWA C522. Under normal operating conditions, the seal will last the life of the valve.

Bronze pivot bearings are provided on the plug trunnions, and the seat rings on the plug engage with the valve body seats during operation.

Link and Lever Torque Unit

Cone Valve's Unique Operating Cycle

The unique operating mechanism of the Cone Valve unseats the plug axially without rotation then smoothly rotates the plug 90°. After rotation, crosshead travel reseats the plug creating a full port unobstructed waterway. This operation provides positive protection for the seats at all times assuring long, maintenance free service.

The progressive effects of this movement are as follows:

- The actuator input shaft moves the crosshead assembly.
- Motion from the crosshead is coupled through a link and lever to a threaded lift nut. As the crosshead moves, it causes the lift nut to rotate. This action causes the threaded stem to rise which lifts the plug off its seat.
- As the crosshead continues to travel, it engages the rotator which causes the plug stem to rotate. This action slowly opens the valve.
- The valve pointer always indicates the position of the valve plug.
- At the end of the opening cycle, the rotator stop screw contacts the actuator housing which stops all rotation of the plug.
- Further travel of the crosshead causes the threaded lift nut to lower the plug to engage the valve body and plug seats.

Cone Valve Link and Lever Torque Unit

The Link and Lever Torque Unit operating mechanism is totally enclosed in its own housing separate from the valve itself and is easily accessible for stem packing replacement or inspection maintenance. Maintenance does not require shut-down of the pipeline. Included in the mechanism housing is an external valve position indicator.

The operating mechanism is designed to allow slight repositioning of the seats in case of future wear.

Operator Characteristics

Operators

Willamette Valves can be supplied with standard manual, electric motor or cylinder operators for most applications. Other operator control accessories can be supplied that allow the user to tailor the valve to specific performance requirements.

Manual Operator

The manual operator is used for any stop service where dependability is critical and where automation is not necessary. Since the valve can be easily operated by one person, no bypass is necessary. The operator is supplied with a standard AWWA handwheel or 2" (50mm) square operating nut.

Hydraulic Cylinder

This operator uses a double-acting piston which opens and closes the valve when pressure is introduced. This is a standard cylinder powered by water or oil, designed per AWWA C541.

Air/Oil Tandem Cylinder

The tandem cylinder is our preferred operator. This air/oil system eliminates the installation of a costly hydraulic accumulator system by using a compressed air supply for a power source. This supply of compressed air also furnishes an accumulated source of energy to provide an emergency closure of the valve during power failure or other unexpected conditions.

smooth operation of oil.

For all valves, emergency fast closing functionality can be provided for rapid closure in the event of loss of power.

Motor Operator

The electric motor operator is available on a standard link and lever torque unit for remote modulating, flow control applications.

Buried and Submersible Service

The operating mechanism is permanently lubricated and can be sealed, making it suitable for submersible service to approximately 20 feet (6m) for extended periods of time. A complete range of stem extensions and valve boxes are available with indicators as well as floor stands.

Low Head Loss — Power Cost Savings

Full ported valves are far more cost effective than other valve types, mainly because of lower head loss. Cone Valves are 100% full ported. There is no more head loss through the valve than there would be in an equivalent length of pipe of the same diameter. 100% full ported Cone Valves can even be pigged.

This table shows the estimated power cost over the life of a pump station. All amounts are based on \$.16/kWh, four pumps running 12 hours per day over a typical pump station life of 20 years. The calculations are based on 70% efficiency with a line velocity of 16 ft/sec (4.9 m/sec). Power costs are much lower than with restricted-port valves such as the butterfly, check, gate or globe valves.

Pounds Kilograms

Smooth Operation Gives Precise Flow and Pressure Regulation

The smooth operating cycle of the Cone Valve is highly effective in controlling surge and water hammer while providing precise flow regulation. The operating cycle is shown below in the graph Percent of Flow Area vs Percent of Stroke. Notice that only 2% of the flow area is opened with nearly 20% of actuator stroke. This is due to the lifting of the conical plug prior to rotation.

Reduced Pressure Loss

This graph shows the head loss between 5 and 70% of the valve opening angle. This is caused by the smooth operation and long stroke of the valve actuator in rotating the valve plug. The result is precise flow and pressure control with no hunting.

Ordering

To order, simply complete the valve order code from information shown. An ordering example is shown for your reference.

Valve Style

Give valve style code as follows:

VMC = Metal Seated Cone Valves (1)

Valve Size

Give valve size code as follows:

6	=	6"	(150mm)	20	=	20"	(500mm)
8	=	8"	(200mm)	24	=	24"	(600mm)
10	=	10"	(250mm)	30	=	30"	(750mm)
12	=	12"	(300mm)	36	=	36"	(900mm)
14	=	14"	(350mm)	42	=	42"	(1100mm)
16	=	16"	(400mm)	48	=	48"	(1200mm)
18	=	18"	(450mm)				

Body Style

Give body style code as follows:

Double Seat Plug - Seat in Closed Position Four Seat Plug - Seat in Both Open & Closed Positions DS

FS

End Connection

Give end connection code as follows:

Flanged ASME 150, Flat Faced Flanged ASME 300, Flat Faced F2

Body Material

Give body material code as follows:

Ductile Iron

Class - AWWA C522

Give class code as follows:

150 Class 150 250 Class 250

Class 300 (F2 end connection only)

Shaft Mounting

Give shaft mounting code as follows:

Horizontal Valve Shaft (Standard)

Vertical Valve Shaft

Body/Plug Seat Material

Give body/plug seat material code as follows:

Monel

Shaft Material

Give shaft material code as follows:

= 17-4PH Stainless Steel

Options

Give option code as follows:

DeZURIK Standard Certified Production Hydrostatic Shell & Seat Test Report

Ordering Example:

VMC,12,DS,F1,DI,150,H,ML-S5*actuator

NOTE: 1. Mounting feet position must be specified as setup text on the order.
